One of the most impressive new features in Photoshop 3D is Face Retrieval. With Adobe Photoshop 3D, you can create a virtual 3D head from an image, either a front portrait, side profile, or behind-the-ear shot. You can then use one of the program's thousands of lighting and make-up effects to give the face a new look. The 3D face can be edited to adjust facial features, change eye color and size, or apply eye makeup. After that, the result can be rendered as a full-color 3D head. You can have the person wear the 3D face on a real head or a Samsung or Google cardboard headset. Another new feature in Photoshop 3D is Face Capture. You can connect any video or camera to your system and it will capture images of your face in a 3D environment. You can insert these 3D face images into any 4K image in Photoshop, as well, so you can do a quick demo with a product in front of the camera. Another feature called Face Spoofing allows you to make a 3D character from a 2D image. When you take a picture of someone, the program analyzes the pixels in the image, and

creates a 3D character from it. That character can then be transferred to any image in Photoshop; it appears as a real 3D face. The initial cost of buying the full Photoshop program is quite high, as is the price of the latest version upgrades. However, it does have a subset of all its functions packaged together for a smaller price. Adobe Photoshop is an application that allows you to edit (change, modify), retouch, and customize a photo. This is done using many Photoshop features such as adjusting brightness and saturation, applying color correction, and using filters. A digital photo filter is a digital filter or calibration that modifies an existing image, usually to enhance it such as to change the color of a monochrome (black and white) image to a more pleasing mixture of colors.
